*STATISTICAL STUDIES, *LIBRARIES, *COLLEGE LIBRARIES, *LIBRARY EXPENDITURES, *LIBRARY STANDARDS, PHILADELPHIA, PENNSYLVANIA

A STATISTICAL STUDY WAS MADE OF THE LIBRARIES OF 669 UNITED STATES LIBERAL ARTS COLLEGES. DATA WERE DISPLAYED IN FIVE DIFFERENT WAYS--(1) ALPHABETICAL LISTING, (2) EXCELLENCE QUOTIENT, (3) NUMBER OF BOOKS, (4) NUMBER OF BOOKS PER STUDENT, AND (5) TOTAL LIBRARY BUDGET FOR SALARIES. EXCELLENCE QUOTIENT WAS EXPRESSED IN TERMS OF A THREE-DIGIT PERCENTILE RANKING. (TC)

"Determining Excellence Quotient for Liberal Arts College Libraries"

Saint Joseph's College
Philadelphia, Pennsylvania

For some years the United States Office of Education has been performing the invaluable task of collecting and publishing annual sets of statistics about the holdings, staff, and other aspects of all libraries connected with institutions of higher learning across the country. This present small study, generously financed by the Office of Education, attempts for three key factors (number of books, number of books per student, and total library budget for salaries) to make it easy for the user to see exactly where among all comparable colleges in the country a given college stands. It also attempts for the first time to compute an objective overall excellence quotient for liberal arts college libraries. While in general the better the college the better the library, this report is in no sense whatsoever to be understood as a ranking of the colleges concerned, merely of their libraries.

This is a statistical study, but it is meant for the non-statistician first and foremost. It was directed by a non-statistician, and this note of explanation is being written by that same non-statistician. (The mechanics, the mathematics, the programming, and the other technical aspects of the study have, of course, been in the hands of experts.) Five minutes practice should enable the least mathematically inclined reader (the writer is a professor of ancient Greek) to find any information in the appropriate tables.

The report consists of a list of 669 liberal arts colleges (all United States liberal arts colleges with sufficient data available) rearranged in five different ways: 1)alphabetically; 2)by an EQ (excellence quotient) specially developed for this study; 3)by number of books; 4)by number of books per student; 5)by total library budget for salaries.

The first list, pages 1 to 9, gives the colleges in alphabetic order by state, and within each state in alphabetic order by the name of the college. It thus serves as a kind of table of contents to the other four lists. After each college name will be found four columns of 3-digit numbers. These numbers are standard scores in the same form as the familiar college-board scores. That is, 500 is about average, 200 extremely poor, and 800 extremely good. (An explanation of standard scores is given at the end of this introduction for those to whom they are new.) The reason for using these standard scores rather than the raw data (which, in any case, is supplied in lists 3, 4, and 5) is simple: one cannot directly compare the number of books a library has with the number of dollars spent on its librarians' salaries. One can, however, compare its relative standing across the country (as shown in standard scores) on these two items, or any other items. The first column is the score for the number of books the college library has (regardless of how many students it has). Similarly, the second column is the score for the number of books per student. The third column represents the score for the total

number of dollars spent for all salaried personnel. It has nothing to do with the average salaries of the individual librarians involved (to reveal which in the case of smaller institutions would practically be publishing individual salaries), but it represents the total budget for all salaries, regardless of how many people this amount is split among, and in what ways. The most original contribution of this study is the attempt to establish a general overall excellence quotient on the basis of these other three scores for liberal arts college libraries as a whole. This is the item found in column four.

List Two, pages 10-18, is identical with List One except that it is arranged from the highest excellence quotient to the lowest excellence quotient. To determine which factors to include in this report, and what relative weight to assign each in computing the excellence quotient, the following procedure was used. A study selecting about 70 top-ranking liberal arts colleges (by combining several norms independent of their libraries) provided a control group. The statistics for the libraries of these colleges were compared with the same statistics for all colleges. The chances that these libraries formed a random sample of all colleges were less than one in a thousand. They were positively, highly non-typical. That they did not represent a set of unusually bad colleges was evident 1) from the norms used in the earlier study; 2) from common sense inspection of the list (which includes a large number of the best known and respected colleges in the country); 3) from the fact that if it did represent a negative group then the nonsense conclusion would follow that it would be better for libraries to have fewer books and smaller budgets for salaries. It is important to remember that this earlier study of college excellence was completely independent of the college libraries.

We then examined about twenty factors (including number of hours of student help, number of periodicals subscribed to, budget for binding, and the like) to determine the key factors, those factors in which there was the closest connection between a high rank and the performance of the colleges on the earlier study which did not deal with libraries. On what library factors did the outstanding colleges perform in most strikingly superior fashion? The factors were in this order: 1) number of books; 2) number of books per student; 3) total budget for salaries. The statistical measure of just how close this connection or relationship was is called the coefficient of correlation, and on this basis we gave the relative weights to be used in the overall excellence quotient. It should also be noted that what was being compared and contrasted was this group of 70 colleges as a whole to all the colleges in the country. Thus one could believe that any one or several of these colleges did not belong on the list, or that several belonged there and were missing, and it would make only slight differences in the results. Also, the 70 model colleges from the earlier study are not necessarilly the 70 colleges with the highest excellence quotient in this study.

A difference in this list of a few places up or down is probably not very meaningful, and like all general scores it should be treated with common sense. A difference of half a page or more is very likely to be significant. And the chances are that libraries close to one another on this list are at least roughly comparable. To find a specific college, take its excellence quotient from List One, (the alphabetic list), column 4, and look for the same quotient in column 4 of list Two (where the quotients run from highest to lowest).

List Three, pages 19 to 27, gives the following data: column 1, the number of students (part-time students counting one-quarter of a student each); column 2, the number of books; column 3, the standard score that this number of books represents considering all comparable libraries across the country; column 4, the percentile (for those who prefer to think in percentiles rather than standard scores); column 5, the rank among all colleges studied. To find an item on this list, find the score for number of books (List One, column 1) and then find the same score in this list, column 3.

List Four, pages 28 to 36, gives: column 1, number of students; column 2, number of books; column 3, number of books per student; column 4, standard score for number of books per student; column 5, percentile; column 6, rank. List One, column 2, corresponds to column 4 here.

List Five, pages 37 to 44 gives: column 1, number of students; column 2, library's total budget for salaries; column 3, standard score for salaries; column 4, percentile; column 5, rank.

Some possible sources of error or irrelevance in the present study are: 1) inaccurate reporting by the library of its raw data; 2) different norms for counting many-volumed sets, duplicates, auxiliary collections; 3) the disadvantage a library suffers that has weeded its collection well of out-of-date material compared with one that keeps and counts everything; 4) the relative incomparability of per-student figures for the very few colleges with extremely small or extremely large enrolments; 5) immeasurables such as the personal dedication of individual librarians; 6) possible distortions of the number of students in cases where there is an unusually large proportion of part-time students; 7) the effect of the lack of the few colleges for which information was not available; 8) changes since 1962-63 (the latest data available when the processing began).

Areas in which it would seem useful to expand this type of study would include: 1)preparing a five-year comparison of the same institutions and of their rate of change; 2)publishing similar lists from highest-to-lowest on many other factors (some of which have

been computed in the work preparatory to this small study); 3) making parallel studies of other types of higher educational institutions (universities, junior colleges, and so on); 4) studying in depth on campus eleven institutions evenly spaced from lowest to highest to provide insight into those features of libraries and library service which cannot be measured in numbers, or for which data have not been collected, and to confirm or modify the conclusions of this present introductory study.

Perhaps it should be noted that all institutions in this list (including a few with the word university in their title) are considered by the Office of Education to be primarily liberal arts colleges.

Lastly, a note on standard scores for those not familiar with them. (Actually, in Lists Three, Four, and Five we have provided percentiles, ranks, and raw data for those who would prefer to use these measures instead of or in addition to the standard scores.) Standard scores were developed to compare results of students' performances on sets of tests where knowing merely the raw number of correct answers would be meaningless. After all "Johnny got 70 answers right in a French test" is a fairly meaningless statement unless we know 1) how many questions there were; 2) how comparable students performed. Let us compare Johnny's 70 to the scores of 4 other students (assuming that 5 took the test): 30, 40, 50, 60, 70. This implies that Johnny did best, something quite different from the series 70, 75, 80, 90, 100. In the first case Johnny is at the top percentile; in the second, he is at the bottom. But let us assume that Johnny is at the 60th percentile (3rd out of 5) and that the scores are 68, 69, 70, 71, 72. This is quite different from being t the 60th percentile with the scores 10, 25, 70, 75, 80, and it is different again from 60, 65, 70, 100, 100. Johnny's 70, to be most meaningfully interpreted, must show what rung of the ladder he stands on among his classmates, and also how far apart most of the rungs are. The Standard Score is a carefully worked out, long tested and accepted, scientific method of showing on which rung anything stands, and the general shape and measurements of the ladder involved.
